**About The Remaining Section**

As mentioned in the previous lecture, the remaining section is all about adding NgRx to the "Recipes" project. You **can skip** all remaining lectures (and mark them as completed manually, if you need that certificate of completion) if you're not interested in them.

It was recorded with an **older version of NgRx** but the syntax shown in the videos **still works** with recent versions of Angular & NgRx *(and is likely to still be encountered in some of the real-world projects you might be working on after taking this course)*.

**Some things to keep in mind:**

**1)** We'll install NgRx via `npm install --save @ngrx/store` => You could use `ng add @ngrx/store` instead (as shown in the previous lectures)

**2)** We'll use the **"old" actions, reducers & effects syntax** (i.e., without `createAction()`, `createReducer()` and `createEffect()`)

=> With the exception of the old effects syntax (which uses `@Effect()`, which is not supported anymore), you **can stick to that syntax**. Alternatively, you can switch to the approach you learned about in the previous lectures.

As mentioned, you'll find **multiple code snapshot attachments** on various lectures - snapshots with the "old" and "new" syntax. This should make following along easy & straightforward.

In addition, you find the **finished project snapshot** (using `createReducer()`, `createAction()` etc.) attached to this lecture already!
